IN THE CLAIMS:

- 1. to 12. (Canceled)
- 13. (New) An information recording medium comprising:
- a pair of electrodes;

a liquid crystal material filled into a gap between said electrodes, the liquid crystal material comprising a rod-shape liquid crystal compound,

said liquid crystal material having a property such that charge-transport properties are varied according to a phase transfer between a plurality of stable liquid crystal phases of the liquid crystal and/or a history of the phase transfer, the phase transfer of the liquid crystal material occurring upon a change in temperature of the liquid crystal material between a crystalline phase at a room temperature to an isotropic phase in a final state through a smectic phase at an elevated temperature,

said liquid crystal material comprising a material selected from the group consisting of a phenylbenzothiazole liquid crystal, 4-hexyloxy-4-butanoylbiphenyl, and a phenylnaphthalene

liquid crystal wherein the phenylnaphthalene is one selected from the group consisting of 2-(4'-octylphenyl)-6-dodecyloxynaphthalene, 2-(4'-octylphenyl)-6-butyloxynaphthalene, 2-(4'-octylphenyl)-6-nonyloxynaphthalene and a mixture thereof,

a thickness of the gap between the electrodes being larger than a domain size of the liquid crystal compound at least in the initial state of the liquid crystal material, and

the thickness of the gap between the electrodes being smaller than a domain size of the liquid crystal compound in a cooled state from the isotropic phase in a final state.

- 14. (New) The information recording medium according to claim 13, wherein the information is recorded by applying thermal energy.
- 15. (New) The information recording medium according to claim 13, wherein the information is read by measuring the value of a photoelectric current generated by light applied to an information recorded portion.

- 16. (New) The information recording medium according to claim 13, wherein at least one of the pair of electrodes is transparent to light.
- 17. (New) The information recording medium according to claim 13, wherein a thermal head or a laser beam is used as means for applying thermal energy for information recording.
- 18. (New) The information recording medium according to claim 13, wherein the phenylbenzothiazole liquid crystal material is 2-(4'-heptyloxyphenyl)-6-dodecylthiobenzothiazole.
- 19. (New) The information recording medium according to claim 13, wherein

the liquid crystal material comprises a liquid crystalline charge-transport material,

a background for information recording is in a state that the charge-transport properties are inhibited attributable to polycrystalline structural defects in the initial state of the liquid crystal charge-transport material, and Rule 1.53(b) Continuation of Serial No. 09/477,725

information recording is carried out by phase transfer caused in the background upon the application of thermal energy.

- 20. (New) The information recording medium according to claim 13, wherein two or more charge-transport properties can be developed in a specific liquid crystal phase according to the level of the thermal energy applied.
- 21. (New) The information recording medium according to claim 13, wherein the pair of electrodes is provided on a substrate.
- 22. (New) The information recording medium according to claim 13, wherein the thickness between the pair of electrodes satisfies both requirements represented by inequalities (A) and (B):
- (A) (Permeation depth at excitation light wavelength of liquid crystal material) < (Thickness between pair of electrodes)

- (B) (Thickness between pair of electrodes) < (Thickness which can exhibit field strength such as to enable reading of photoelectric current).</p>
 - 23. (New) A device comprising:
 - a pair of electrodes;
- a liquid crystal material filled into a gap between said electrodes, the liquid crystal material comprising a rod-shape liquid crystal compound,

said liquid crystal material having a property such that charge-transport properties are varied according to a phase transfer between a plurality of stable liquid crystal phases of the liquid crystal and/or a history of the phase transfer, the phase transfer of the liquid crystal material occurring upon a change in temperature of the liquid crystal material between a crystalline phase at a room temperature to an isotropic phase in a final state through a smectic phase at an elevated temperature, and

a thickness of the gap between the electrodes being smaller than a domain size of the liquid crystal compound in a cooled state from the isotropic phase in a final state.
